Abstracts

The global UV-LED Surface Light Source market size is expected to reach \$ 877 million by 2032, rising at a market growth of 4.9% CAGR during the forecast period (2026-2032).

In 2025, global UV-LED surface light source production reached approximately 1016 k units, the average price is 600 usd/unit. UV-LED surface light source is a semiconductor light-emitting device that directly generates ultraviolet light. It integrates high-power LED chips with a light-emitting wavelength of 200nm to 450nm according to a certain ratio to form a light source with a peak wavelength of a certain wavelength in the 200nm-450nm band.

Market Concentration and Key Players:

From an international perspective, the market concentration of UV-LED surface light sources is relatively high, mainly concentrated in developed countries such as Europe, America and Japan. For example, Phoseon Technology and POMEAS and other large manufacturers; from the domestic point of view, UV-LED surface light source manufacturers have Shenzhen Yousheng Technology and Futanxi.

Manufacturing Processes and Market Trends:

The core of UV-LED surface light source manufacturing process is to achieve high precision, high efficiency and high reliability of the light curing ability, the key links include the use of multi-chip integrated technology to ensure uniformity of irradiation, and with advanced heat management system to ensure stable output and long life of the light source. The specific process involves accurately arranging LED chip arrays on

a metal substrate, improving the uniformity of irradiation to more than 95% through optical designs such as microlens arrays, and controlling the fluctuation of chip junction temperature within a very small range by using closed-loop liquid cooling or intelligent air cooling systems. Programmable constant current sources are commonly used in the driving system to achieve accurate regulation of light intensity and irradiation time.

The current market is showing strong growth. This increase was mainly due to strict environmental regulations driving the elimination of traditional mercury lamps and the continuous improvement of UV-LED technology in photoelectric conversion efficiency. Future trends focus on intelligence and customization, such as self-optimization of process parameters and predictive maintenance of equipment through integrated AI algorithms and Internet of Things technologies, and providing industry-specific deep customization solutions for special needs in semiconductor packaging, new energy battery manufacturing, medical devices and other segments will become the core competitiveness of enterprises.
