Abstracts

Using ultraviolet (UV) printing technology, an insulating shell can be sprayed on the surface of lithium batteries. The purpose of this is to increase the safety and durability of lithium batteries. The insulating shell can prevent the battery from direct contact with the external environment and reduce the risk of possible short circuits. It can also protect the internal structure of the battery and improve the battery's anti-aging ability and service life. The UV printing process is usually able to cure quickly, improve production efficiency, and can achieve precise control during the spraying process to ensure that the outer casing is evenly covered on the battery surface.

According to our (Global Info Research) latest study, the global UV Spray Printing market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
