UV vacuum coating is a special type of coating mainly used in the fields of optics and electronics. It applies thin films or coatings to the substrate through vacuum evaporation technology, and the process is carried out in a low-pressure environment to minimize pollution and ensure precise control of coating thickness. UV 'in UV vacuum coating refers to the use of ultraviolet (UV) light during the curing or drying process. After applying the coating to the substrate using vacuum evaporation, UV light is used to initiate a chemical reaction, causing the coating to harden and adhere correctly to the surface. UV vacuum coating is renowned for producing high-quality, durable, and efficient coatings with excellent adhesion and optical properties. This technology is commonly used in applications that require precise control of film thickness and require high performance characteristics.
