A vacuum bag sampler is a device used to collect air samples for environmental testing. It consists of a vacuum pump, a sample collection bag, and a sampling probe. Insert the sampling probe into the tested environment and use a vacuum pump to suck air through the probe into the sample collection bag. Then seal the bag and send it to the laboratory for analysis. Vacuum bag samplers are commonly used for indoor air quality testing to evaluate the presence of pollutants such as mold, bacteria, and volatile organic compounds (VOCs). They are also used for outdoor air quality testing to measure the concentration of particulate matter and other pollutants. The advantage of using a vacuum bag sampler is that it can collect a large amount of air, which improves the accuracy of test results.
