Abstracts

According to our (Global Info Research) latest study, the global Vacuum Homogenizing Emulsifier market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The vacuum homogeneous emulsifier mainly refers to the use of a high-shear emulsifier to quickly and evenly distribute one phase or multiple phases into at least another continuous phase under a vacuum state. It uses the strong kinetic energy brought by the machine to make the material In the narrow gap between the stator and the rotor, it withstands hundreds of thousands of hydraulic shears per minute. The comprehensive effects of centrifugal extrusion, impact, tearing, etc. instantly disperse and emulsify evenly. After high-frequency cycles, we finally obtain a bubble-free, delicate and stable high-quality product.

Emulsifier equipment needs to get rid of low production capacity and increase speed, so as to create higher production efficiency; equipment configuration must be gradually improved, and the cleaning system, overload system, especially the detection system has few optional systems and the current situation of too large volume needs to be further improved ; The processing of the filling valve needs to be further improved; the system of the equipment itself is expected to be more perfect, and once the equipment stops operating, it is hoped that the motor can be protected through some details. The emulsifier equipment is hardware. To maximize its advantages, it needs to be equipped with corresponding software. This includes a complete set of maintenance, repair, and management measures, as well as the cooperation of professionally qualified personnel. For the specific situation of emulsifier equipment, it is necessary to formulate a system that suits the situation and establish an excellent equipment management

system. Therefore, it will take time for the vacuum homogenizing emulsifier to mature.
