The global Vacuum Slotting Machine market size is expected to reach \$ 1157 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032). A dust-collecting grooving machine is a mechanical device used for grooving operations in construction and road construction, featuring an integrated dust collection function. This equipment precisely grooves the surface of materials such as concrete and asphalt using rotating cutting tools, while a powerful dust collection system simultaneously removes dust and debris generated during construction, maintaining a clean working environment and reducing air pollution and health hazards for operators. Dust-collecting grooving machines are widely used in the construction of cable trenches, pipe trenches, and crack repair, and are particularly suitable for use in locations with high environmental hygiene requirements.

The upstream of the dust-collecting grooving machine industry chain mainly includes suppliers of motors, electrical control systems, gears and reducers, wear-resistant cutting tools, machine body materials, and dust collection device components; the midstream consists of dust-collecting grooving machine manufacturers, responsible for mechanical structure design, motor and drive system integration, cutting and dust collection system matching, and complete machine assembly and testing. This is the core link of the industry chain, with high technological content and a gross profit margin typically in the 20%-40% range, especially for high-performance, high-power, low-noise, and high-efficiency dust collection models. The downstream mainly includes users in the construction, road paving, water conservancy, subway, and municipal pipeline construction industries. Products are also provided to end-users through construction machinery dealers, e-commerce platforms, and leasing services. Market demand is driven by infrastructure investment and updates to construction standards.

In 2025, the average price of vacuum-equipped grooving machines will be \$290 per unit, with sales reaching 2565 k units.

The introduction of vacuum grooving machines has brought significant environmental and health benefits to the building and road construction industries. Compared with traditional grooving equipment, this equipment can not only complete cutting tasks efficiently, but also reduce dust pollution generated during the construction process through a built-in vacuum system, improve the air quality of the construction site, and help protect the health of workers. In addition, reducing the spread of dust can also help maintain the cleanliness of the construction area and improve construction quality and efficiency. In the context of the current emphasis on environmental protection and worker health, vacuum grooving machines undoubtedly represent the upgrade direction of grooving technology, and are expected to be more widely used in construction, municipal engineering and other fields in the future.
