Abstracts

According to our (Global Info Research) latest study, the global Valve Controlled Photoelectric Direct Reading Cold Water Meter market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

The photoelectric direct-reading water meter (LXZD) consists of a high-precision mechanical water meter embedded with a photoelectric direct-reading module and an M-BUS data communication module. While performing normal mechanical measurement, it can be powered by the bus and read the mechanical dial value without distortion.

The photoelectric direct-reading remote-transmission cold water meter can transmit data over long distances, view water data information on the terminal server and implement supervision. It not only completes the prepayment function, but also can monitor in real time, so that the managers of the water department can see it next to the computer. If there is a sudden problem of water seepage or water leakage within the managed area, the background management will send out an abnormal prompt. The staff can remotely close the valve without going to the scene to improve the efficiency of the operation and reduce the water source. The outflow has accelerated the construction of smart water infrastructure.
