## Abstracts

According to our (Global Info Research) latest study, the global Vanadium Catalyst for WSA Process market size was valued at US\$ 61.78 million in 2025 and is forecast to a readjusted size of US\$ 90.09 million by 2032 with a CAGR of 5.8% during review period.

Wet-process acid production vanadium catalysts are vanadium pentoxide-based sulfuric acid catalysts specifically designed for use in wet-gas sulfuric acid processes. Their primary function is to catalyze the oxidation of  $\text{SO}_2$  to  $\text{SO}_3$  within sulfur-bearing process gases that possess high moisture content and have not undergone complete drying; the resulting  $\text{SO}_3$  is subsequently converted into sulfuric acid through downstream condensation or absorption processes. Compared to traditional catalysts used in dry-process contact methods, these catalysts place a greater emphasis on maintaining catalytic activity, mechanical strength, and service life under conditions characterized by high water vapor concentrations, elevated acid dew points, temperature fluctuations, and complex tail gas compositions.

The upstream segment of the industry consists primarily of raw material suppliers, driven by core inputs such as vanadium salts—including ammonium metavanadate and vanadium pentoxide—as well as diatomaceous earth (serving as a support material) and potassium or cesium salts (acting as promoters). The midstream segment encompasses catalyst manufacturing, involving core processes such as batching, molding, drying, and high-temperature calcination; the technological barriers to entry in this segment are significantly higher than those for standard vanadium catalysts.

In 2025, global sales volume is projected to reach approximately 7,979 tons, with an

average market price of approximately \$7,524 per ton. The industry's gross profit margin typically falls within the range of 15% to 30%.
