Vancomycin for Home Infusion refers to the administration of the antibiotic vancomycin in a home healthcare setting through intravenous (IV) infusion. Vancomycin is primarily used to treat serious infections caused by Gram-positive bacteria, including methicillin-resistant *Staphylococcus aureus* (MRSA). Home infusion therapy allows patients to receive treatment outside the hospital, typically through a peripherally inserted central catheter (PICC) or other long-term IV access device. This approach improves patient comfort, reduces hospital stays, and lowers healthcare costs while maintaining clinical effectiveness, provided that proper monitoring of drug levels (trough concentrations), renal function, and infusion-related reactions is maintained.
