Vapor degreasers are industrial cleaning systems that use the vapor of a boiling solvent to clean contaminants—such as oils, greases, waxes, and particulates—from metal, plastic, or glass components. The process involves placing parts in a chamber where they are exposed to solvent vapors, which condense on the cooler surfaces of the items and dissolve the contaminants. The condensed solvent, now carrying the contaminants, then drips off the parts, effectively cleaning them without immersion. Vapor degreasing is widely used in aerospace, electronics, medical device, and precision manufacturing industries due to its effectiveness, speed, and ability to clean complex geometries without leaving residues.
