Abstracts

The pressure oil of the variable displacement plunger pump enters the lower cavity of the variable displacement casing through the pump body and the oil hole in the variable casing of the pump casing through the check valve. When the pull rod moves downward, the servo piston is pushed downward, and the servo valve The upper valve port is opened, and the pressure oil in the lower chamber of the variable housing enters the upper chamber of the variable housing through the oil hole in the variable piston. Since the area of the upper chamber is larger than that of the lower chamber, the hydraulic pressure pushes the piston to move downward, driving the pin shaft to make the variable head Rotate around the center of the steel ball, change the inclination angle of the variable head (increase), and the flow rate of the plunger pump will increase accordingly. On the contrary, when the pull rod moves upward, the inclination angle of the variable head changes in the opposite direction, and the flow rate of the pump also changes accordingly. When the inclination angle changes to zero, the variable head changes to the negative angle direction, the liquid flow changes direction, and the inlet and outlet ports of the pump change.
