Abstracts

Guide wire is the 'pioneer' for entering human peripheral blood vessels. Its functions are: import; support; open; exchange.

According to our (Global Info Research) latest study, the global Vascular Catheter Guide Wire market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The surface of the guide wire currently used is generally covered with a hydrophilic film to ensure its lubricating passage in the vascular lumen. Often divided into ordinary (soft) guide wire, hardened guide wire and special micro guide wire. Among them, the ordinary (soft) guide wire is used for general angiography and treatment. The diameter is mostly 0.035in (0.89mm), and it has a certain hardness and twist control force. The length can be 145cm, 180cm and 260cm long. Its front end can be designed as a soft tip with different lengths (2-10cm) to reduce the damage to the inner wall of the blood vessel. The stiffened guide wire is designed for situations that require extremely strong support (such as PTA treatment, stent placement, and stent-grafts). Its lengths are 90cm, 180cm and 260cm. The head end is a soft head design (length 3-7cm), which can be curved or straight. The micro-guide wire is mainly used for renal artery and head and carotid arterioplasty. It is made of super elastic memory metal material with strong supporting force. The tip has a platinum soft tip, which can easily pass through the stenotic section of the blood vessel without damaging the inner wall of the blood vessel. Most of them are 0.018in (0.46mm) in diameter and up to 300cm in length.
