A vascular covered stent is a medical device used in interventional cardiology and vascular surgery to treat narrowed or blocked blood vessels (arteries or veins) and reinforce their structural integrity.

A vascular covered stent, also known as a covered stent, is a medical device used in the treatment of vascular diseases. It is a specially designed stent used to address issues of narrowing or blockage in arteries or veins. What sets a covered stent apart is the presence of a specialized thin membrane covering its surface, which helps prevent re-narrowing or blockage of the blood vessel wall after stent placement. It typically consists of a metallic mesh stent covered with a biocompatible membrane, aiding in stabilizing the vessel and promoting blood flow. Vascular covered stents play a crucial role in the treatment of cardiovascular diseases, providing an effective option for vascular support in patients.
