Abstracts

A vascular transilluminator is a medical device that uses a specific light source to transilluminate the skin and capture images of subcutaneous blood vessels. Its working principle is based on the absorption and reflection characteristics of blood vessels for specific light. By transilluminating the skin tissue, the blood vessels form a visible image on the skin surface. This technology has important clinical value for observing vascular structures, assessing blood circulation, and assisting in the diagnosis of vascular-related diseases.

According to our (Global Info Research) latest study, the global Vascular Transilluminator market size was valued at US\$ 146 million in 2023 and is forecast to a readjusted size of USD 218 million by 2030 with a CAGR of 5.5% during review period.
