According to our (Global Info Research) latest study, the global Vehicle Gamma Spectrometer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A vehicle-mounted gamma spectrometer is a radiation detection system used to detect and measure gamma radiation emitted by radioactive materials. It is typically mounted on vehicles for environmental monitoring, geological surveys and radiation mapping. The system consists of a gamma-ray detector, usually a scintillation crystal or germanium detector, and associated electronics for signal processing and data acquisition. The detectors are shielded to reduce background radiation and mounted on booms extending from the vehicle to provide a wide field of view. As the vehicle moves, the detectors measure the strength and energy of gamma radiation emitted from the ground or other sources. The data is then processed to create a map of radiation levels in the area. This information can be used to identify and locate sources of radiation, such as radioactive waste or natural deposits of uranium or thorium. Overall, vehicle-mounted gamma spectrometers are important tools for detecting and monitoring radiation levels in the environment, with applications ranging from nuclear power plant monitoring to environmental remediation.
