Abstracts

The global Vehicle Multi-View Camera System (MVCS) market size is expected to reach \$ 10627 million by 2032, rising at a market growth of 11.9% CAGR during the forecast period (2026-2032).

The Vehicle Multi-View Camera System (MVCS) is a multi-camera-based in-vehicle vision assistance system. It typically uses wide-angle cameras mounted at the front, rear, and side mirrors or sides of the vehicle to capture real-time images of the surrounding environment. An image processing controller performs distortion correction, perspective conversion, and image stitching to create a 360° panoramic overhead view or multi-view monitoring image of the vehicle's surroundings. This system is primarily used for parking, reversing, navigating narrow roads, low-speed turning, blind spot observation, and obstacle recognition, helping drivers to more intuitively understand the vehicle's surroundings and reducing the risk of scrapes and collisions. With the development of automotive intelligence, surround-view monitoring systems are gradually integrating with automatic parking, ADAS, transparent chassis, 3D surround view, and intelligent cockpit display systems, becoming an important feature for improving vehicle safety and driving convenience. By 2025, approximately 28 million units are expected to be installed globally.

In recent years, with the rapid development of automotive intelligence, electrification, and advanced driver assistance technologies, the Vehicle Multi-View Camera System (MVCS) has become an important configuration for improving parking safety, low-speed driving safety, and intelligent cockpit experience, and market demand has continued to grow. A Vehicle Multi-View Camera System (MVCS) usually uses multiple wide-angle cameras installed at the front, rear, left, and right sides of the vehicle to capture real-time images of the surrounding environment. Through image processing controllers,

distortion correction, perspective transformation, image stitching, and dynamic display technologies, the system generates a 360-degree bird's-eye view or multi-angle image around the vehicle. This helps drivers better understand the surrounding environment during reversing, parking, narrow-road passing, low-speed turning, and complex driving conditions, thereby reducing blind spots, scratches, and collision risks.

From the industry chain perspective, upstream suppliers mainly include automotive camera modules, CMOS image sensors, optical lenses, ISP image processing chips, domain controllers, connectors, wiring harnesses, displays, algorithm software, and electronic components. The midstream consists of MVCS system integrators, automotive electronics companies, and Tier 1 suppliers. Downstream customers mainly include automakers, automotive sales and service networks, and the aftermarket retrofit market. Industry competition is not only reflected in camera resolution, image stitching quality, system response speed, and environmental adaptability, but also in algorithm capability, automotive-grade reliability, cost control, platform-based development capability, and integration with vehicle electronic and electrical architectures. As automotive electronic architectures evolve toward centralization and domain control, suppliers with integrated software and hardware capabilities and vehicle-level delivery capabilities will gain stronger competitive advantages.

From a regional perspective, China, Europe, North America, Japan, and South Korea are the major demand regions for global Vehicle Multi-View Camera Systems (MVCS). The rapid development of new energy vehicles and intelligent vehicles in China has continuously increased MVCS installation rates. In Europe and North America, the popularization of ADAS, safety regulations, demand for high-end vehicles, and upgrades in automatic parking configurations are steadily increasing system value. Japan and South Korea have strong automotive electronics foundations, and their automakers adopted parking assistance and in-vehicle vision systems relatively early. In the future, with the upgrading of intelligent configurations in mid- and low-end vehicle models and the improvement of automotive consumption structures in emerging markets, MVCS is expected to further expand its installation scale.

Looking ahead, the global Vehicle Multi-View Camera System (MVCS) market will be driven by three major factors. First, consumers' demand for parking safety, low-speed assistance, and driving convenience will continue to increase. Second, the upgrading of new energy vehicles, intelligent cockpits, and ADAS configurations will further improve system penetration. Third, technologies such as high-definition cameras, AI vision algorithms, 3D multi-view imaging, transparent chassis, and automatic parking integration will continue to mature. Market growth will be reflected not only in higher

installation volumes, but also in the value improvement brought by high resolution, multi-camera fusion, intelligent recognition, and software algorithms.
