Abstracts

The global Vein Graphite market size is expected to reach \$ 29 million by 2029, rising at a market growth of 5.1% CAGR during the forecast period (2023-2029).

Vein Graphite is considered a naturally occurring form of pyrolytic (deposited from a liquid phase) graphite. Veined graphite gets its name from the fact that it occurs in the veins and fissures of closed 'ore' rocks. This graphite is formed by the direct deposition of solid graphitic carbon from subterranean high-temperature fluids called pegmatite fluids. Vein graphite is used in battery cells, carbon brushes, refractory materials and lubricants as well as in powder metallurgy and the plastics industry. This type of graphite gained its name from where it is found in rock: The needle-shaped ore forms in wide veins that fill crevices in the earth's crust. In terms of product types, carbon purity: 95%-99% is the first segment of the vein graphite market, accounting for 53.73%. It is widely used in the fields of automobile and metallurgy, accounting for 65.44% of all application fields.
