Abstracts

This facilitates the medical practitioner's task and also reduces the patient discomfort. Very often, the veins of elderly patients and children are hard to reach, which causes the procedure to be more painful. Dehydration, obesity, certain medications, and drug abuse can also lead to difficulty in accessing veins. When using vein illuminator devices, the infrared light of the device is absorbed by the hemoglobin in the blood. When the device is held above the skin, veins appear noticeably different from the surrounding tissue and are, thus, highlighted. The vasculature shows up clearly on the skin's surface, aiding in vein location to collect a blood sample or administer IV medications

SCOPE OF THE REPORT:

This report focuses on the Vein Illumination Device in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. The growth of the vein illuminator market would be driven by its increasing success in finding the appropriate vein to draw blood or for IV access in the first attempt. This facilitates the medical practitioner's task and also reduces the patient discomfort. Very often, the veins of elderly patients and children are hard to reach, which causes the procedure to be more painful. Dehydration, obesity, certain medications, and drug abuse can also lead to difficulty in accessing veins.
