Abstracts

Ventricular drainage equipment is a type of medical equipment used for timely extra-ventricular drainage of the brain, monitoring and management of intracranial pressure changes, and removal of blood in the ventricle, which can effectively solve the increase in intracranial pressure.

According to our (Global Info Research) latest study, the global Ventricular Drainage Equipment market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Trauma and tumors can cause hydrocephalus, which increases the pressure on the patient's brain and leads to a series of neurological symptoms. Ventricular drainage can change these symptoms. Usually, most patients with hydrocephalus caused by brain tumors disappear after the brain tumor is removed, while hydrocephalus caused by other causes with increased cerebrospinal fluid pressure must be treated by surgery. Because the clinical use of extraventricular shunt method. This method is simple and reliable. The current shunt system consists of two sections of conduit and a one-way valve. The catheter to be placed at the end of the ventricle is called the proximal catheter. Catheters intended to be placed in the abdominal cavity, or occasionally in the right atrium, are called distal catheters. Both catheters are connected to a one-way valve that controls the flow, flow and pressure of the cerebrospinal fluid.
