## Abstracts

Vermicompost is the product of the composting process using various species of worms, usually red wigglers, white worms, and other earthworms, to create a heterogeneous mixture of decomposing vegetable or food waste, bedding materials, and vermicast, also called worm castings, worm humus or worm manure, is the end-product of the breakdown of organic matter by an earthworm. These castings have been shown to contain reduced levels of contaminants and a higher saturation of nutrients than do organic materials before vermicomposting.

Vermicompost, or vermiculture, most often uses two species of worms: Red Wigglers (*Eisenia foetida*) or *Eudrilus eugeniae* rarely found in soil and are adapted to the special conditions in rotting vegetation, compost and manure piles.

According to our (Global Info Research) latest study, the global Vermicompost market size was valued at US\$ 281 million in 2023 and is forecast to a readjusted size of USD 720 million by 2030 with a CAGR of 14.6% during review period.
