Abstracts

The global Vertical Drilling Fully-automatic Balancing Machine market size is expected to reach \$ 307 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

The vertical drilling automatic balancing machine is an intelligent balancing equipment used for disc-shaped rotating workpieces (such as brake discs, flywheels, pulleys, etc.). It integrates measurement, drilling and weight removal correction, and re-measurement functions into a vertical structure, achieving fully automatic operation. Through high-precision measurement and automated drilling to remove imbalances, it significantly improves the balancing efficiency and accuracy of mass production.

The upstream sector mainly involves precision mechanical components and electronic control systems. Core hardware includes high-precision electrical measurement systems, high-speed variable frequency motors, precision spindles, servo drive systems, pneumatic components, and drilling and balancing mechanisms.

The price of vertical automatic drilling and balancing machines varies considerably, influenced by factors such as the number of workstations, degree of automation, rotor specifications, and precision requirements. Prices typically range from US\$20,000 to US\$50,000. Sales are projected to reach approximately 5,500 units in 2025, with industry gross profit margins ranging from 30% to 45%.

The driving forces mainly stem from the continuous emphasis on NVH (noise, vibration, and harshness), reliability, and consistency in automotive and electric drive systems, as well as the strong demand for cycle time, yield rate, and automation in manufacturing.

Leading manufacturers have integrated high-performance drilling units into vertical balancing platforms, enabling automatic unbalance assessment, correction calculation, and weight removal through drilling. These systems also support vertical and horizontal drilling to accommodate different workpiece geometries and process requirements.

These types of equipment often require the development of specialized positioning fixtures/adapters, drilling units (spindle systems/tools/chip removal), and safety guards tailored to the target parts. They also need to be integrated with loading/unloading, conveying, and MES traceability systems. Therefore, most models are sold on a project-based pricing/delivery-by-production-line basis.
