A Vertical Fluid Bed Dryer (VFBD) is a type of industrial drying equipment used for removing moisture from wet granules or other particulate materials. It operates on the principle of fluidization, which involves passing a gas (usually air) through a bed of solid particles. In a vertical configuration, the airflow is directed vertically upward, causing the particles to become suspended and behave like a fluid. As the fluidized particles are continuously mixed by the airflow, moisture is rapidly removed from the surface, leading to faster drying times compared to conventional drying methods. Vertical fluid bed dryers are widely used in various industries, including pharmaceuticals, food processing, chemical manufacturing, and more, to dry powders, granules, and other bulk materials.
