Abstracts

According to our (Global Info Research) latest study, the global Vessel-mounted ADCP market size was valued at US\$ 65.6 million in 2024 and is forecast to a readjusted size of USD 107 million by 2031 with a CAGR of 5.3% during review period.

A vessel-mounted ADCP relies on the same principles as a stationary ADCP, producing a profile of the currents between the vessel and the seabed. However, vessel-mounted ADCPs encounter an extra layer of complication while measuring, because the vessel on which they are mounted is moving. This means the ADCP will have to account for the speed and direction of the vessel when determining the velocity of the currents beneath it. Thankfully, an ADCP can also calculate the speed of the vessel over the seabed, using a technique called “bottom tracking.” To perform bottom tracking, the ADCP measures the Doppler shift of a ping that bounces off the seabed, rather than scatterers in the water like with current measurements. This effectively measures the speed of the vessel relative to the sea floor.

This report is a detailed and comprehensive analysis for global Vessel-mounted ADCP market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Type and by Application.
