According to our (Global Info Research) latest study, the global Vest Type Expectorator Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The working principle of the vest-type expectorant machine is that the system simulates the principle of normal physiological cough. The host (built-in pneumatic pulse generator) generates high-frequency compressed air, and the transmission hose connected to the inflatable vest reciprocates at high speed to inflate and deflate the vest. Make the patient's chest wall produce regular diastolic movements. When a certain frequency is reached, the chest cavity wrapped by the vest will fall off, similar to a slight coughing action. Loosens and liquefies mucus and metabolites on the mucosal surface of the respiratory airways. Make it smaller and loose and fall off. After the sputum has moved from the bronchi to the main trachea, it is expelled by coughing.
