Abstracts

The global Veterinary Pharmaceuticals market size is expected to reach \$ 40922 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

Veterinary pharmaceuticals are medicines and biologics used to prevent and treat diseases in animals across companion and food-producing species. The category spans preventive biologics (e.g., vaccines) and therapeutic products such as antiparasitics, anti-infectives, anti-inflammatory/pain management drugs, dermatology/allergy therapies, and reproduction/metabolic care. Supply and use are heavily shaped by regulatory approvals, food-safety residue controls for livestock, and veterinary oversight—raising the bar for efficacy, safety, and responsible use.

Growth is underpinned by two structural forces: first, “humanization” of companion-animal care is lifting willingness to pay and normalizing chronic disease management (e.g., dermatology/allergy, OA pain, cardio-renal and metabolic care), which supports higher-value prescription therapeutics and preventive routines. Second, continued intensification of livestock/aquaculture systems—combined with outbreak risk and trade-related health requirements—drives sustained investment in vaccines, biosecurity, and targeted treatments to protect productivity and supply stability; WOA also highlights vaccination and biosecurity as key levers to prevent disease and reduce reliance on antimicrobials.
