Abstracts

Veterinary radiography consists of diagnostic medical images generated in veterinary practice, including ultrasonography, CT, MRI, and nuclear imaging. It is essential in providing excess information by noninvasive means. Veterinary radiography is painless; however, sedation is often required to reduce anxiety and stress associated with the procedure in animals.

Scope of the Report:

The major factors that drive the growth of the market are increase in animal healthcare expenditure, growth in pet insurance purchase, and rise in preference for companion animals. In addition, increase in veterinary practitioners and surge in disposable income in developed regions supplement the market growth. However, high cost of veterinary imaging instruments and dearth of skilled professionals restrain this growth. Moreover, the development of portable veterinary radiography devices is expected to offer lucrative opportunities for the expansion of this market.

The worldwide market for Veterinary Radiography is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
