Abstracts

The global Veterinary Sutures market size is expected to reach \$ 2654 million by 2032, rising at a market growth of 7.2% CAGR during the forecast period (2026-2032). Veterinary sutures are sterile medical devices used to close surgical incisions or wounds in animals during veterinary procedures, including soft tissue surgery, orthopedic operations, and emergency trauma care. These products are available in absorbable and non-absorbable forms and are manufactured using materials such as polyglycolic acid, polydioxanone, nylon, polypropylene, and silk. In 2025, the global consumption of veterinary sutures is estimated at approximately 10.0 thousand tons, with an average selling price of around US\$158,000 per ton. The industry maintains a gross margin of 62%?78%, supported by stable procedural demand, standardized veterinary procurement systems, and gradual shifts toward higher-performance synthetic suture materials.

Industry analysis suggests that veterinary sutures are gradually shifting from basic consumables toward differentiated surgical materials. Competitive positioning increasingly depends on absorbability profiles, tensile strength stability, knot security, and compatibility with minimally invasive veterinary procedures rather than price competition alone.

This report studies the global Veterinary Sutures production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Veterinary Sutures and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2025 as the base year.
