Abstracts

According to our (Global Info Research) latest study, the global Vibrating Distributor market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Vibrating separator is a device that uses vibration force to separate or classify materials according to different particle sizes, shapes or specific gravity. It can be widely used in mining, metallurgy, building materials, chemical industry, food and other industries to improve the quality and utilization of materials. The main structural components of the vibration distributor include: vibration source, distribution trough, bracket, spring, electric control box, etc. The vibration source can be a vibration motor, an exciter or an eccentric shaft, etc., which can generate periodic vibration force and drive the distributing trough to perform reciprocating or circular motion. The distribution trough is a container for loading materials. Its shape, size and inclination can be designed according to the characteristics of the materials and the material distribution requirements. The bracket is a structure used to fix and support the material distribution trough. It can be a steel frame, a wooden frame or a concrete frame, etc. The spring is an elastic component connecting the material distribution trough and the bracket. It can buffer the impact of vibration force and reduce noise and vibration transmission. The electric control box is a device used to control the working status of the vibration source. It can adjust the size, frequency and phase of the vibration force to achieve the best material distribution effect. The working principle of the vibration distributor is: when the vibration source works, it will generate a certain vibration force, causing the distribution trough to vibrate along a certain trajectory. The material is affected by the vibration force and its own gravity in the material distribution trough, causing jumping and throwing movements. At the same time, it is guided by the material distribution trough and moves

in a certain direction and speed. When the material moves to the outlet of the material distribution chute, it will be separated or classified into different grades or categories according to the particle size, shape or specific gravity of the material, so as to achieve the purpose of material distribution.
