A Vibrating Inclined Screen is a mechanical screening device that is designed to separate solid particles of different sizes through a combination of vibration and an inclined plane. It consists of a perforated or meshed screen surface that is set at an angle to the horizontal. A vibrating mechanism is attached to the screen frame, which imparts a continuous oscillating motion to the screen. The material to be screened is fed onto the upper end of the inclined screen. As the screen vibrates, the smaller particles pass through the holes or openings in the screen, while the larger particles travel along the surface of the inclined screen due to the inclination and are discharged from the lower end of the screen, thus achieving the purpose of particle - size classification.
