According to our (Global Info Research) latest study, the global Vibrating Tube Feeder market size was valued at US\$ 46 million in 2024 and is forecast to a readjusted size of USD 82.9 million by 2031 with a CAGR of 8.9% during review period.

Vibrating Tube Feeder is a type of mechanical conveyor system designed to transport bulk materials through a tubular structure using vibratory motion. This feeder consists of a tube that vibrates at a controlled frequency, typically driven by an electromagnetic or electromechanical drive. The vibrations cause the material inside the tube to move smoothly along the length of the feeder, providing a continuous and uniform flow of materials. Vibrating tube feeders are widely used in industries such as mining, food processing, pharmaceuticals, and chemicals, as they offer precise control over the flow rate, minimize material degradation, and ensure a steady, efficient transfer of materials with minimal maintenance. They are particularly effective in handling fine powders, granules, and small particulates that may otherwise be difficult to convey using traditional methods.
