#### **Abstracts**

The global Vibration Viscometer market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Vibration viscometer: The working principle of this viscometer is: when the object in the fluid vibrates, it will be hindered by the fluid, and the size of this effect is related to the viscosity of the fluid. Commonly used vibrating viscometers are ultrasonic viscometers, and there is a shrapnel in the detector. When excited by the pulse current, the shrapnel produces mechanical vibrations in the ultrasonic range. When the shrapnel is immersed in the tested sample, the amplitude of the shrapnel is related to the viscosity and density of the sample. In the case of known density, the viscosity value can be obtained from the measured amplitude data.

This report studies the global Vibration Viscometer production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Vibration Viscometer, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
