According to our (Global Info Research) latest study, the global Viral and Non-viral Vector market size was valued at US\$ 998 million in 2025 and is forecast to a readjusted size of US\$ 2311 million by 2032 with a CAGR of 12.9% during review period.

Viral and non-viral vectors are delivery systems used to transfer genetic material into cells for therapeutic or research purposes. Viral vectors are modified viruses engineered to carry and deliver specific genes, taking advantage of their natural ability to infect cells. Common examples include adenoviruses, lentiviruses, and adeno-associated viruses (AAV). Non-viral vectors, on the other hand, are synthetic or naturally derived systems that do not rely on viruses. These include liposomes, nanoparticles, electroporation, and plasmid DNA. While viral vectors offer high efficiency in gene delivery, non-viral vectors are often preferred for their lower immunogenicity, easier production, and enhanced safety profiles.
