## Abstracts

The global Virtual Therapy Platform market size is expected to reach \$ 3058 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

To address the problems of low accessibility, high cost, and significant patient stigma associated with traditional psychotherapy, virtual therapy platforms have emerged. Since their rise in the early 21st century with the development of the internet and digital technologies, the field of mental health services has gradually entered a new digital phase. Currently, virtual therapy platforms have developed into a professional health service system covering various forms, including self-help exercises, real-time video consultations, AI-assisted interventions, and immersive VR therapy. They are widely used in personal psychological adjustment, clinical auxiliary diagnosis and treatment, employee support programs, and community mental health promotion, significantly improving service coverage, personalization, and accessibility of treatment.

Through technological innovation and model innovation, virtual therapy platforms are reshaping the service and efficiency boundaries of the healthcare industry. Their core value lies not only in improving diagnostic accuracy and patient experience but also in promoting the universalization of medical resources and the proactive management of health. In the future, driven by policy, technology, and demand, virtual therapy platforms are expected to become a core infrastructure in the digital health era, bringing about revolutionary changes to the global healthcare system.
