According to our (Global Info Research) latest study, the global Virus Cryopreservation market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Virus cryopreservation is a biotechnology that allows long-term preservation of virus in living tissues or in suspension medium by freezing them at very low temperatures, usually below -70°C . The aim of virus cryopreservation is to maintain the viability and infectivity of the virus without altering its genetic stability. Virus cryopreservation requires the use of cryo-protectant agents, such as glycerol, dimethyl sulfoxide (DMSO) or fetal bovine serum (FBS), to prevent ice crystal formation and damage to the virus structure.
