Abstracts

The global Virus Cryopreservation market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Virus cryopreservation is a biotechnology that allows long-term preservation of virus in living tissues or in suspension medium by freezing them at very low temperatures, usually below -70°C . The aim of virus cryopreservation is to maintain the viability and infectivity of the virus without altering its genetic stability. Virus cryopreservation requires the use of cryo-protectant agents, such as glycerol, dimethyl sulfoxide (DMSO) or fetal bovine serum (FBS), to prevent ice crystal formation and damage to the virus structure.

This report studies the global Virus Cryopreservation production, demand, key manufacturers, and key regions.

This report is a detailed and comprehensive analysis of the world market for Virus Cryopreservation, and provides market size (US\$ million) and Year-over-Year (YoY) Growth, considering 2022 as the base year.
