According to our (Global Info Research) latest study, the global Virus Pesticide market size was valued at US\$ 3099 million in 2024 and is forecast to a readjusted size of USD 5908 million by 2031 with a CAGR of 9.8% during review period.

Viruses are used as pesticides to achieve disease resistance and insecticide, and can play a short-term control role for microbial pesticides. After use, it is possible for the virus to exist in the agricultural and forestry ecosystem for a long time, and as a kind of introduced ecological factor, it plays a role in regulating the population density of pests. This is an insecticide that has the effect of comprehensively killing insects and controlling the number of pest populations. It has created a new era of insecticides. The key difference from other pesticides is that it can form a 'pest plague' in the pest population. , It is not easy to produce resistance, convenient and safe high-efficiency insecticide.

More and more attention has been paid to the application of viral pesticides in the field of agriculture. Compared with traditional chemical pesticides, viral pesticides have many advantages, such as high selectivity, environmental friendliness, non-residue, low toxicity to non-target organisms and lower risk of developing resistance. These features make viral pesticides an important part of sustainable and eco-friendly farming.
