The global Virus Removal Filter System market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Virus Removal Filter System is a key equipment used in biopharmaceutical production. Its main function is to remove virus particles from biological products. These viral particles may be present in biological products, such as biopharmaceuticals, vaccines, gene therapy products, etc., and therefore need to be effectively removed during the production process to ensure the safety and purity of the final product.

Virus Removal Filter System usually uses special filter membranes or other filter media that can selectively remove different sizes or types of virus particles through principles such as pore size or chemical affinity. These systems usually combine multi-stage filtration, centrifugation, ultrafiltration and other technologies to ensure efficient removal of target viruses.
