The global VIS CAMERAS market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

'VIS cameras' are imaging devices specifically designed to capture visible light within the electromagnetic spectrum. 'VIS' stands for 'visible,' indicating that these cameras are optimized to detect wavelengths of light that are visible to the human eye, typically ranging from approximately 400 to 700 nanometers. VIS cameras are commonly used in photography, videography, microscopy, surveillance, scientific research, and industrial applications where capturing images or videos in the visible spectrum is necessary. These cameras may utilize various technologies such as CCD (charge-coupled device) or CMOS (complementary metal-oxide-semiconductor) sensors to convert light into electronic signals, producing high-quality images with accurate color reproduction and detail.
