## Abstracts

The global Viscose Fibre market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

One of the key drivers of the viscose fiber market is the growing demand for sustainable and eco-friendly textiles. Viscose fiber, also known as rayon, is derived from natural materials such as wood pulp and bamboo, making it a renewable and biodegradable alternative to synthetic fibers. As consumers become more environmentally conscious, there is an increasing preference for clothing and textiles made from sustainable materials. Another driver is the rising disposable income and changing consumer preferences in emerging economies. As developing countries experience economic growth, consumers have more purchasing power and are willing to spend on higher-quality clothing and textiles. Viscose fiber offers a cost-effective option that provides a similar feel and appearance to natural fibers like cotton and silk, making it a popular choice among price-sensitive consumers.

Viscose fibre, also known as rayon, is a type of regenerated cellulose fiber that is widely used in the textile industry. It is produced by chemically treating cellulose, typically obtained from wood pulp or cotton linters, and then extruding the treated cellulose through spinnerets to form continuous filaments.

This report studies the global Viscose Fibre production, demand, key manufacturers, and key regions.
