A ship viscous damper is a device installed on the ship structure that uses the damping properties of viscous fluid to dissipate energy and reduce vibration and impact. When a ship is vibrated and impacted by wind and waves, propeller excitation, engine operation, etc. during navigation, the viscous fluid (usually silicone oil, etc.) in the viscous damper will flow under the action of the piston or other moving parts, and the internal friction between the fluid molecules will convert mechanical energy into heat energy and dissipate it, thereby effectively suppressing the vibration response of the ship structure and improving the comfort, safety and reliability of the ship.
