## Abstracts

Visible optics refer to optical components and systems designed to manipulate, transmit, or detect visible light, which is the portion of the electromagnetic spectrum that the human eye can perceive, approximately in the wavelength range of 380 nm to 750 nm. These optics are foundational to numerous devices and applications in both scientific research and everyday technology due to their ability to control and work with light that is visible to humans.

Visible optics encompass a wide array of lenses, mirrors, prisms, filters, and other optical elements that are optimized for performance within the visible light spectrum. These components are crucial for directing, focusing, splitting, or altering the properties of visible light in various optical systems.

According to our (Global Info Research) latest study, the global Visible Optics market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
