Abstracts

The global Vitamin D Testing market size is expected to reach \$ million by 2032, rising at a market growth of %CAGR during the forecast period (2026-2032).

Vitamin D is vital for strong bones. It also has important, emerging roles in immune function and cancer prevention. Deficiencies at any stage of life can have devastating consequences. Similarly, vitamin D toxicity resulting from overmedication can cause serious hyperkalemia. Vitamin D consists of two bioequivalent forms:

Vitamin D2: obtained from vegetable sources (dietary sources, supplements)

Vitamin D3: derived from both endogenous (synthesized from cholesterol through sun exposure) and exogenous (animal diet) sources

Vitamin D deficiency is more common than previously believed, especially among adolescents, women, and the elderly. For example, studies have shown that more than 50% of the institutionalized elderly and an equal proportion of women of any age undergoing treatment for osteoporosis have inadequate levels of vitamin D.¹ While treatment with vitamin supplementation is easy and inexpensive, many affected individuals go undiagnosed and untreated.

The total 25-hydroxyvitamin D (25-OH-VitD) level (the sum of 25-OH-vitamin D2 and 25-OH-vitamin D3) is the appropriate indicator of vitamin D body stores. Although there is no universal consensus about a treatment cut point, studies suggest 25 to 35 ng/mL as the minimal concentration of 25-OH-VitD needed to avoid the adverse effects of deficiency.^{2,3,4} By contrast, population reference ranges do not correspond with healthy ranges. In northern latitude locations in particular, one-third of the population

may have vitamin D levels less than 25 ng/mL at the end of winter.
