Abstracts

A vitamin transdermal patch is a type of transdermal patch designed to deliver specific vitamins through the skin and into the bloodstream over a period of time. These patches typically contain a formulation of various vitamins, such as vitamin B12, vitamin D, or vitamin C, among others. The patches adhere to the skin and release the vitamins gradually, allowing for absorption through the skin barrier. This method of delivery is used as an alternative to oral supplements and may be beneficial for individuals who have difficulty swallowing pills or who prefer a more convenient method of vitamin supplementation.
