Vitiligo treatment device is a medical device dedicated to the treatment of vitiligo. Vitiligo, also known as white spot disease, is a chronic skin disease characterized by the appearance of pigment loss patches on the skin, commonly found on the head, face, neck, waist, limbs and other parts. The disease occurs due to the destruction, deficiency or dysfunction of melanocytes. Vitiligo treatment device helps restore the skin color affected by vitiligo through different treatment methods. The main treatment method is to use ultraviolet rays with specific wavelengths (such as UVB ultraviolet rays, 308 nanometer excimer lasers, etc.) to irradiate the white spots. This treatment method can stimulate the function and production of pigment cells, thereby restoring the color of the skin. Phototherapy is beneficial to the function of melanocytes and the production of melanin by inducing apoptosis of local T lymphocytes. Phototherapy equipment such as UVB ultraviolet phototherapy device and 308 nanometer excimer laser therapy device have been widely used in clinical practice and have shown good efficacy.
