Abstracts

The global VOC Removal Catalysts market size is expected to reach \$ 4111 million by 2032, rising at a market growth of 8.1% CAGR during the forecast period (2026-2032).

VOC removal catalysts are functional materials used to promote the catalytic oxidation of volatile organic compounds (VOCs) under certain conditions, converting them into harmless substances such as carbon dioxide and water. These catalysts typically use precious metals (such as platinum and palladium) or transition metal oxides as active components, supported on porous carriers (such as alumina, molecular sieves, or honeycomb ceramics). By lowering the activation energy, they achieve highly efficient purification at lower temperatures and are widely used in industrial waste gas treatment, coating, petrochemical, printing, and electronics manufacturing to reduce organic waste gas emissions and meet environmental emission standards.

The upstream of the VOC removal catalyst industry chain mainly includes suppliers of precious metal raw materials (such as platinum, palladium, and rhodium) and transition metal oxides (such as manganese, copper, and cobalt), carrier materials (honeycomb ceramics, alumina, and molecular sieves), and basic chemical raw materials. The midstream consists of catalyst and catalyst module manufacturers, responsible for formula development, coating molding, active component loading, and system integration; this is the core value link of the industry chain. The downstream is mainly used in waste gas treatment systems in industries such as petrochemicals, coating, spraying, printing, electronics manufacturing, pharmaceuticals, and waste treatment. In terms of gross profit margin, the upstream precious metals and basic materials segment is affected by resource attributes and price fluctuations, with gross profit margins typically ranging from 10% to 30%. Midstream catalyst production and system integration, due to high technological barriers and strong product customization,

generally have gross profit margins ranging from 30% to 60%, with high-performance precious metal catalysts or customized solutions having even higher margins. Downstream environmental engineering and end-use applications are mainly project-based, and overall profit levels depend on the scale of the project and system integration capabilities.

In 2025, the average price of VOC removal catalysts was US\$11,000/ton, with sales volume of 211.8 k tons and a total VOC removal catalyst production capacity of 300 k tons.

VOC removal catalysts are one of the key technological pathways in the current treatment of industrial organic waste gas. With increasingly stringent environmental regulations and the advancement of the 'dual carbon' goal, their importance in VOCs emission reduction systems continues to rise. The industry as a whole is shifting from traditional precious metal catalysts to low-cost, highly stable, and more poison-resistant non-precious metal catalysts and composite catalytic systems, while making continuous breakthroughs in material structure (such as honeycomb carriers), low-temperature ignition performance, and lifespan optimization. In the future, the development of VOC catalysts will focus more on synergistic integration with overall waste gas treatment systems (such as RTO, RCO, and adsorption-catalysis coupling processes), as well as improving adaptability under complex operating conditions (high humidity, high sulfur, high dust). Companies with formulation technology advantages and engineering experience will have a more advantageous position in market competition.
