According to our (Global Info Research) latest study, the global VoIP Media Gateways market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

As VoIP has been in development for more than twenty years. In the past, it has primarily been the low-price alternative for long-distance or international phone calls. It is ideal audio call solutions for enterprises, often called IP Telephony. As the rise of wireless networks and the broadening of infrastructure bandwidth in most countries, network communication has become a regular trend. The market for enterprise network communication has been growing dramatically, and there is also growing demand for video conferencing. Through VoIP technology, internet access devices can facilitate audio calls, send text messages, fax, video conferences, etc., through cellular and Wi-Fi networks.

There are a diversity of structures for VoIP systems installed for enterprises that include different equipment such as Communication Server, (also called SIP Server or IP PBX Server), Media Server, Application Server, Media Gateway, IP PBX Network Switch, the conventional PBX Switch, IP Phone, Video-Conferencing System, management and other peripheral softwares.

As the scale of enterprise VoIP systems can be large or small. For example, media servers and application servers can be placed in a single unit or separately. In the case of separate installation, the overall structure can be deployed more flexibly such as multiple application servers utilizing the same media server for resource sharing.

Amongst the VoIP systems, it has often seen the integration of the communication server, the media server, and the application server to a multimedia communication server of only 1U or 2U size. There are new VoIP Media Gateway products integrated with the communication server or with the media server, which has a single-board server slotted within the VoIP media gateway that shall feature adequate functions, ideal for network communication of small enterprises or the branch offices of large corporations.

A VoIP Media Gateway is a telecommunication networking device that performs translation between different technologies, protocols, and networks. Networks such as Public System Telephone Network (PSTN), Next Generation Networks (NGN), and Wireless Networks, can all be interconnected together using a VoIP Media Gateway. The primary function of VoIP Media Gateways is analog-to-digital conversion of voice and creation of voice IP packets. Today's telecommunication is not limited to audio, as it involves showing information in multiple media formats, thus, VoIP Media Gateway has been developed to integrate data, audio, video, and fax transmission through a single platform. VoIP is the abbreviation of Voice over Internet Protocol, an IP-based technology to facilitate voice calls. Simply put, it is communication carried out via the internet for audio calls and multimedia meetings. VoIP technology is a series of procedures of transcoding, encoding, compression, and packing. The basic path for the audio to reach the receiving end from the transmitting end is firstly the audio-to-electronic conversion, i.e., the sound wave from the transmitting end converted to the simulated electronic signals; then, the simulated electronic signals are converted to the digital signals through sampling and encoding before transmitting waves of compressed frames with IP addresses and control messages. Frames are packed in layers to generate IP packets that can be correctly delivered to the destinations amongst the vast network. When arriving at the destinations, IP packets are converted to simulated audio signals that can be broadcasted through speakers, receivers or earphones, via de-packing, code restoration, and lectro-acoustic conversion to facilitate the two-side voice calls.
