Abstracts

According to our (Global Info Research) latest study, the global Voltage Pressure Sensor market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The voltage type air pressure sensor is a sensor that uses the piezoresistive effect to measure air pressure. Its basic structure is a capacitor composed of an elastic diaphragm with a piezoresistive piece and a fixed electrode. When air pressure acts on the diaphragm, the diaphragm will deform, causing the resistance value of the piezoresistive film and the capacitance value of the capacitor to change, thereby generating a voltage signal proportional to the air pressure. The advantages of voltage-type air pressure sensors are simple structure, fast response speed, and easy processing of output signals. They are suitable for measuring dynamic air pressure and static air pressure. The disadvantage of voltage-type air pressure sensors is poor temperature stability, which is affected by temperature, humidity, mechanical vibration and other factors, and requires temperature compensation and calibration.
