A vortex cooler is a small cooler that does not use refrigerants such as chlorofluorocarbons. The vortex effect, caused by the structure of internal components called vortex tubes, can create cold air as cold as minus 60 degrees Celsius using compressed air. The temperature of the cold air is determined by the cold air ratio on the hot air side. Hot air produced by heat exchange inside the cooler is automatically discharged. Since there are no moving parts, there is no need to worry about breakdowns, and maintenance is not required.

Vortex coolers are used for cooling purposes in production sites. Specifically, it is used to cool high-temperature solder, knives, etc., and for rapid cooling during plastic processing. Vortex coolers are also widely used in various other fields, such as cooling electronic equipment and control boxes.
