According to our (Global Info Research) latest study, the global VPN Server Software market size was valued at US$ 1849 million in 2024 and is forecast to a readjusted size of USD 5113 million by 2031 with a CAGR of 15.8% during review period.

A virtual private network (VPN) extends a private network across a public network, and enables users to send and receive data across shared or public networks as if their computing devices were directly connected to the private network. ('In the simplest terms, it creates a secure, encrypted connection, which can be thought of as a tunnel, between your computer and a server operated by the VPN service.') Applications running across the VPN may therefore benefit from the functionality, security, and management of the private network.
