VPX (VITA 46) is a high-performance computing platform that is designed to support advanced signal processing applications. It is based on a ruggedized form factor that is designed to withstand harsh environments, making it well-suited for use in military and aerospace applications.

The VPX platform is built around a set of industry standards that define the physical and electrical characteristics of the system, including the backplane, modules, and connectors. This allows different vendors to develop and integrate components from different manufacturers, providing a high degree of flexibility and interoperability.

The VPX platform is designed to support a wide range of signal processing applications, including radar, sonar, image and video processing, and wireless communications. It supports a range of processing units, including multi-core CPUs, digital signal processors (DSPs), and graphics processing units (GPUs), as well as a range of high-speed interconnects, such as PCI Express, Serial RapidIO, and Ethernet.

The VPX platform also includes a range of software and development tools, including operating systems, drivers, and development environments, that enable developers to create and deploy custom applications on the platform. Additionally, the platform includes features such as system health monitoring and hot-swappable modules, which make it easy to maintain and upgrade the system over time.
